 Scholarly Project Advisor – Dr. Lori Kulju, Ph. D., RN

## Problem Statement

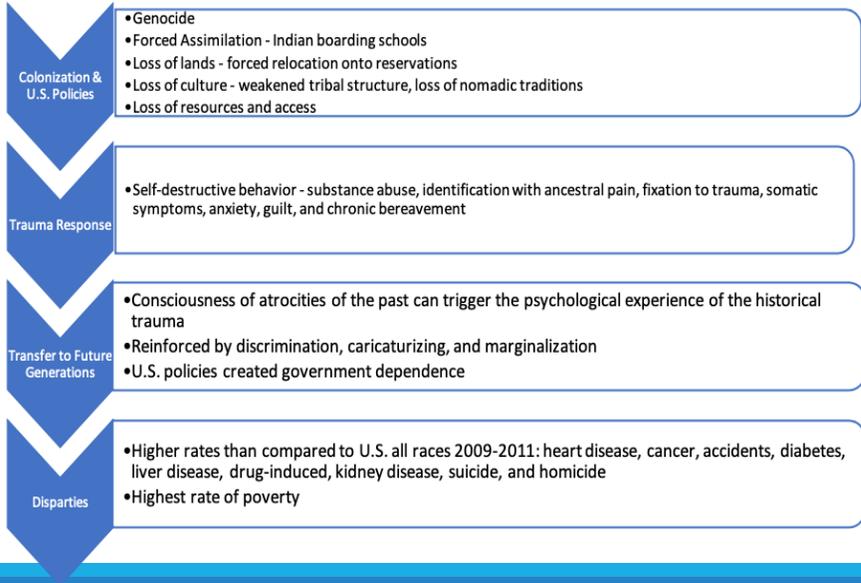

- Prevalence of diabetes in the US American Indian/Alaska Native (AIAN) population is twice that of the non-Hispanic white population<sup>2</sup>
- AIANs experience higher complication rates<sup>2</sup>
- 2.5 times more likely to die from diabetes than non-Hispanic whites<sup>2</sup>
- Diabetic management, including self-management, is lacking in the AIAN population.
- Providers working with the AIAN population must understand the impact of unique stressors and self-management outcomes

## Purpose

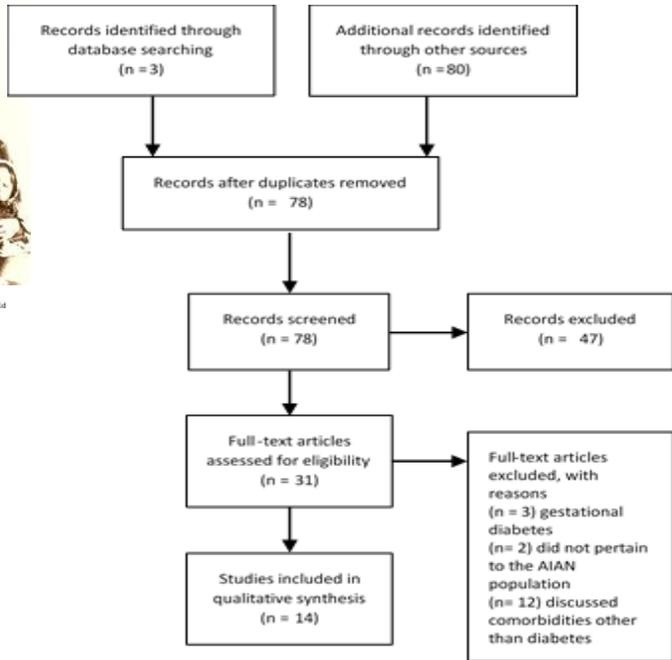

- Relate AIAN history to the identification of stressors that contribute to poorer diabetic outcomes and self-management practices
- Identify unique stressors that contribute to higher rates of diabetes and poor diabetic outcomes in the AIAN population.

## Theoretical Frameworks

- Leininger’s Culture Care Theory<sup>3</sup>
- Brave Heart and DeBruyn’s Historical Trauma Theory<sup>1</sup>

## Search Summary

## ROL Summary

- Four major themes emerged as unique stressors to the AIAN with diabetes:
- Access to healthy foods/diet
  - Stressors on overall health
  - Access to resources necessary to manage diabetes
  - Historical trauma/response

## Conclusions

- AIANs have unique stressors to diabetic self-management related to historical trauma
- APRNs must create a culturally sensitive care environment
- APRNs can improve AIAN diabetic self-management by engaging in cultural humility

## Implications and Recommendations

- Research**
- Expansion and further explanation into themes discussed
  - Relate historical trauma response and AIAN diabetic outcomes – develop and test interventions
  - Region or tribal specific differences?

- Practice**
- Cultural humility
  - Consider culture, history, traditions, and values when prescribing, educating, and care planning.
  - The responsibility lies with us!
